

KYC (Know Your Customer)

How q/acc (Quadratic Accelerator) protocol uses Privado ID to prevent Sybil attacks and ensure compliance with legal requirements.

The Quadratic Accelerator is a collaborative entity under Giveth building the q/acc protocol based on the research of Commons Stack.

The protocol team needed an identity partner to provide KYC checks to onboard new and existing users to the Giveth platform.

Simplify user authentication while preventing Sybil attacks

The q/acc team uses Privado ID to make the process easy by:

- Allow users to complete a liveness check to prove their identity, claim proof of humanity credential, and follow FATA AML guideline for KYC
- Letting users claim reusable credentials that can be shared as zero-knowledge proofs (ZK-proofs) to protect their privacy
- Enabling users to make payments directly to the issuer using Privado ID's payment system.

This case study shows how Privado ID can simplify user authentication while protects partners against Sybil attacks.
