

Verification

How Sedax uses Privado ID to speed up identity verification in hospitality services, reducing data exposure while keeping identity checks secure and reliable.

Sedax is a blockchain-based ID verification system designed to prevent identity theft, financial fraud, and data leaks.

The challenge Sedax faced was slow and inefficient identity verification processes in the hospitality industry, both for government and private services.

Speed up identity verification processes while reducing data exposure.

To address this, Sedax partnered with the Government of Uttar Pradesh in India to issue Aadhar as a verifiable credential (VC) in the hospitality sector.

Sedax uses Privado ID to pilot this program by:

- Issuing government-verified digital credentials like Aadhar using the Issuer Node Core API.
- Using on-chain revocation to ensure credentials remain valid across services.
- Improving data privacy and portability with self-sovereign identities.

This case study shows how Privado ID can transform identity management for government services.
