

Onchain Education Credentials

How IDS uses Privado ID to facilitate trusted, verified academic credentials for students in India's Polyversity Metaverse and beyond.

Information Data Systems (IDS), founded in 1996, helps enterprises and governments adopt new technologies.

They faced challenges in securely managing and verifying student credentials across various educational institutions in India.

Enable trusted and verified academic credentials for students

To solve this, IDS partnered with AICTE, India's technical education regulatory body, to issue digital educational credentials to students, making it easier for them to navigate the Polyversity metaverse and beyond.

With Privado ID, IDS:

- Issues academic credentials as Verifiable Credentials (VCs).
- Provides students with an identity management wallet through the JS SDK.
- Ensures privacy-preserving verification of academic records using zero-knowledge proofs.

This case study shows how Privado ID can transform identity management in education, promoting accessibility, transparency and simplifying the verification process.
